

PERFORMING COMPRESSION OF USER DATAGRAM PROTOCOL PACKETS

ABSTRACT OF THE DISCLOSURE

5           Performing compression includes receiving at a  
compressor a flow comprising packets, where each packet  
has a packet identifier. The packet identifiers are  
associated with a predetermined increment, but any change  
in the predetermined increment is ignored. The packets  
10       are compressed, and the flow is transmitted to a  
decompressor.
